

WHAT IS CLAIMED IS:

1. A display device comprising
 - a substrate;
 - a gate line formed over the substrate;
 - a first insulating film formed over the substrate and the gate line;
 - a semiconductor film formed over the first insulating film;
 - a drain electrode formed over the semiconductor film;
 - a source electrode formed over the semiconductor film;
 - a data line connected to the drain electrode and formed over the first insulating film;
 - a second insulating film formed over the source electrode and the first insulating film; and
 - a pixel electrode electrically connected to the source electrode and formed over the second insulating film,
wherein a conductive film is disposed between the substrate and the semiconductor film under the data line.
2. A display device according to claim 1, wherein the conductive film is disposed between the substrate and the first insulating film.
3. A display device, according to claim 2, wherein a width of the conductive film is larger than that of the semiconductor layer under the data line.
4. A display device according to claim 2, wherein the conductive film is an opaque metal.

5. A display device according to claim 4, wherein a transparent conductive film connected to the data line through a contact hole formed in the second insulating film, and the transparent conductive film is electrically connected to an external drive circuit.
6. A display device according to claim 4, wherein the conductive film is a light-blocking member.
7. A display device comprising:
 - a substrate;
 - a gate line formed over the substrate;
 - a first insulating film formed over the substrate and the gate line;
 - a semiconductor film formed over the first insulating film;
 - a drain electrode formed over the semiconductor film;
 - a source electrode formed over the semiconductor film;
 - a data line connected to the drain electrode and formed over the first insulating film;
 - a second insulating film formed over the source electrode and the first insulating film; and
 - a pixel electrode electrically connected to the source electrode and formed over the second insulating film,

wherein a conductive film is disposed between said substrate and the first insulating film in such a manner as to cover spacing between the pixel electrode and

the data line adjacent thereto; and

wherein the semiconductor film is interposed between the first insulating film and a portion of the data line overlying the conductive film for increasing spacing between the data line and the conductive film to reduce electro-static coupling between the data line and the conductive film.

8. A display device according to claim 7, wherein a width of the data line is larger than that of the semiconductor layer.

9. A display device according to claim 7, wherein the conductive film is disposed between the substrate and the first insulating film in such a manner as to cover spacing between the pixel electrode and the data line adjacent thereto.

10. A display device according to claim 7, wherein the conductive film is an opaque metal.

11. A display device according to claim 10, wherein a transparent conductive film connected to the data line through a contact hole formed in the second insulating film, and the transparent conductive film is electrically connected to an external drive circuit.

12. A display device according to claim 10, wherein the conductive film is a light-blocking member.
